1. What is Category Theory?

Category theory is a language for talking about structuralist mathematics.

- materialism: an object is understood in terms of what it consists of
- structuralism: an object is understood in terms of its relationships to other objects

1.1. Motivating example

Let $D^2 = \{(x, y) \in \mathbb{R}^2 \mid x^2 + y^2 \leq 1\}$. Then let $S^1 = \{(x, y) \in \mathbb{R}^2 \mid x^2 + y^2 = 1\} \subseteq D^2$.

Theorem 1.1 (Brouwer's fixed point theorem): If $f : D^2 \rightarrow D^2$ is continuous, then f has a fixed point. That is, there is some $x \in D^2$ such that $f(x) = x$.

The proof uses a trick and facts about homology. Effectively, there is a machine that takes a topological space (subsets of \mathbb{R}^2) and spits out a vector space (over \mathbb{R}).

- 1) For every topological space X , there is a vector space $H(X)$ (omitting actual definition).
- 2) For every continuous function $f : X \rightarrow Y$, there is an “induced” linear map given by $H(f) : H(X) \rightarrow H(Y)$.
- 3) If $X \xrightarrow{f} Y \xrightarrow{g} Z$ are continuous maps, $H(f) : H(X) \rightarrow H(Y)$, $H(g) : H(Y) \rightarrow H(Z)$ and $H(g \circ f) : H(X) \rightarrow H(Z)$, then $H(g \circ f) = H(g) \circ H(f)$.
- 4) For any X , $H(\text{id}_X) = \text{id}_{H(X)} : H(X) \rightarrow H(X)$.

Computations:

- 5) $H(D^2) \cong 0$.
- 6) $H(S^1) \cong \mathbb{R}$.

PROOF: Assume $f : D^2 \rightarrow D^2$ is continuous and $f(x) = x$ for all $x \in D^2$. Define a new function $r : D^2 \rightarrow S^1$ such that $r(x)$ = intersection of the ray from $f(x)$ to x with $S^1 \subseteq D^2$.

Key fact: If $x \in S^1$, then $r(x) = x$. Check that r is also continuous.

The diagram above commutes. Now we can apply homology to it.

$$\begin{array}{ccc}
 & H(D^2) & \\
 H(\iota) \nearrow & & \searrow H(r) \\
 H(S^1) & \xrightarrow{H(\text{id}_{S^1})} & H(S^1)
 \end{array}$$

We can check that

$$\begin{aligned}
 H(r) \circ H(\iota) &= H(r \circ \iota) \\
 &= H(\text{id}_{S^1}) \\
 &= \text{id}_{H(S^1)}.
 \end{aligned}$$

Therefore, the new diagram also commutes. So, if $w \in H(S^1)$, then

$$w = \text{id}_{H(S^1)}(w) = H(r)(H(\iota)(w)) = 0.$$

This is a contradiction as $H(S^1) \neq 0$. ■

1.2. Categories

Definition 1.2 (Category): A category \mathcal{C} consists of:

- a collection of objects, $\text{Ob}(\mathcal{C})$. For any $A \in \text{Ob}(\mathcal{C})$, we usually write $A \in \mathcal{C}$.
- for any pair of objects $A, B \in \mathcal{C}$, there is a collection of morphisms $\text{Hom}_{\mathcal{C}}(A, B)$, or $\text{Hom}(A, B)$, or $\mathcal{C}(A, B)$. Instead of $f \in \mathcal{C}(A, B)$, we write $f : A \rightarrow B$ or $A \xrightarrow{f} B$.
- for any objects $A, B, C \in \mathcal{C}$ and morphisms $f : A \rightarrow B$ and $g : B \rightarrow C$, there is a specified composition $g \circ f : A \rightarrow C$.
- for any object $A \in \mathcal{C}$, there is a given $\text{id}_A : A \rightarrow A$
- compositions are associative: $(g \circ f) \circ h = g \circ (f \circ h)$
- for any $A \xrightarrow{f} B$, $f \circ \text{id}_A = f = \text{id}_B \circ f$

Example 1.3:

- Set, the category of sets (& functions).

Definition 1.4 (Monoid): A monoid $(M, *)$ consists of:

- a set M
- a binary operation $* : M \times M \rightarrow M$
- an identity element $e \in M$ such that $\forall x \in M, e * x = x * e = x$.

Definition 1.5 (Monoid Homomorphism): A monoid homomorphism $f : M \rightarrow N$ is a function satisfying

- $f(xy) = f(x)f(y)$.
- $f(e) = e$.

Definition 1.6 (Functor): A functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is a function satisfying

- $F(A) \in \mathcal{D}$ for all $A \in \mathcal{C}$.
- $F(f) : F(A) \rightarrow F(B)$ for all $f : A \rightarrow B$ in \mathcal{C} .
- $F(g \circ f) = F(g) \circ F(f)$ for all $f : A \rightarrow B$ and $g : B \rightarrow C$ in \mathcal{C} .
- $F(\text{id}_A) = \text{id}_{F(A)}$ for all $A \in \mathcal{C}$.

1.3. 09/02/2025

Two “sorts” of categories:

- “concrete” categories: sets with some sort of familiar structure (groups, rings, modules, etc.)
- “abstract” categories: $\mathbb{1}$, $\mathbb{2}$, $\mathbb{3}$, etc. More formal symbols than not.

Definition 1.7 (Endomorphism): An endomorphism $f : A \rightarrow A$ is a morphism from an object to itself.

New categories from old:

1) Product category.

- input: two categories \mathcal{C} and \mathcal{D}
- output: $\mathcal{C} \times \mathcal{D}$
- objects: (A, B) where $A \in \text{Ob}(\mathcal{C})$ and $B \in \text{Ob}(\mathcal{D})$
- morphisms: (f, g) where $f : A \rightarrow A'$ in \mathcal{C} and $g : B \rightarrow B'$ in \mathcal{D}
- composition: $(f, g) \circ (f', g') = (f \circ f', g \circ g')$
- identity: $(\text{id}_A, \text{id}_B)$

Projection functors on $\mathcal{C} \times \mathcal{D}$:

- $\pi_1 : \mathcal{C} \times \mathcal{D} \rightarrow \mathcal{C}, \pi_2 : \mathcal{C} \times \mathcal{D} \rightarrow \mathcal{D}$.
- on objects: $\pi_1((A, B)) = A$
- on morphisms: $\pi_1((f, g)) = f : A \rightarrow A'$.

2) Slice categories, coslice categories

- input: a category \mathcal{C} and an object $X \in \text{Ob}(\mathcal{C})$
- output: \mathcal{C}/X or X/\mathcal{C}

description of coslice:

- objects: pair (A, f) , where $A \in \text{Ob}(\mathcal{C})$ and $f : A \rightarrow X$ in \mathcal{C}
- morphisms: from $(A, f) \rightarrow (B, g)$: morphism $k : A \rightarrow B$ of \mathcal{C} such that $k \circ f = g$.

- composition: $(A, f) \xrightarrow{k} (B, g) \xrightarrow{l} (C, h)$ is $(A, f) \xrightarrow{l \circ k} (C, h)$. We can check that $(l \circ k) \circ f = h$. The TLDR for this is that you can copy and paste commutative diagrams and get another commutative diagram.

Example 1.8 (*Coslice*): Let $\mathcal{C} = \text{Set}$, $X = 1 = \{*\}$. So $\text{coslice } X/\mathcal{C} = 1/\text{Set} = ?$.

- objects: pairs (A, f) of a set A and a function $f : 1 \rightarrow A$.
- morphisms: functions k such that $k \circ f = g$.

Elements of sets categorically. A is a set. How do we express $a \in A$ in terms of the category Set ?

elements of $A \longleftrightarrow$ functions $f : 1 \rightarrow A$

$$a \in A \longleftrightarrow f : 1 \rightarrow A, f(*) = a$$

$$f(x) \in A \longleftrightarrow f : 1 \rightarrow A.$$

3) Opposite category.

- input: a category \mathcal{C}
- output: \mathcal{C}^{op}
- objects of \mathcal{C}^{op} : A^* for $A \in \mathcal{C}$.
- morphisms of \mathcal{C}^{op} (A^*, B^*): f^* for $f : A \rightarrow B$ in \mathcal{C} .
- composition: $(f^* \circ g^*) = (g \circ f)^*$
